Assignment 3

Ruofei HUANG(z5141448) Anqi ZHU(z5141541)

May 29, 2018

1 Task 1

1.1 Some useful symbol definitions about manipulating words

A **word**, as mentioned in the assignment specification, is defined as a finite sequence of letters over $L = 'a', .., 'z'$. The specification already defines the relationship of '$\leq$' between a **word** v and a **word** w (which means v is a prefix of w or w itself if $v \leq w$).

So we would like to further this definition and define a relationship of '$<$' when v is a proper prefix of w which cannot be w itself if $v < w$. That means:

$$v < w \Leftrightarrow v \leq w \wedge v \neq w$$

We also would like to define a symbol $|w|$ that represents the length of a *word* w.We formally define this by:

$$|w| = \begin{cases} 0 & \text{if } w = \epsilon \\ 1 + |w'| & \text{else} \end{cases}$$

$$where\ \exists l \in L\ \{w = w'\ l\}$$

1.2 Syntactic(Abstract) Data Type *Dict*

Inspired by the program sketch and the assignment statement, we could describe the syntactic data type *Dict* as below (the encapsulated state would be a dictionary word set W).

$$Dict = (W = \phi,$$
$$\left(\begin{array}{l} \textbf{proc}\ addword^{Dict}(\textbf{word}\ w) \cdot b, W : [\text{TRUE}, b = b_0 \wedge W = W_0 \cup \{w\}] \\ \textbf{func}\ checkword^{Dict}(\textbf{word}\ w) : \\ \quad \mathbb{B} \cdot \textbf{var}\ b \cdot\ b, W : [\text{TRUE}, b = (w \in W) \wedge W = W_0];\ \textbf{return}\ b \\ \textbf{proc}\ delword^{Dict}(\textbf{word}\ w) \cdot b, W : [w \in W, b = b_0 \wedge W = W_0 \backslash \{w\}] \end{array} \right))$$

2 Task 2

2.1 Data Type Refinement

Now we would like to refine $Dict$ to a second data type $DictA$ where we replace W with a trie t. We would also like to define the domain of a t as $\mathbf{dom}(t)$. We shall use this definition later in our refinement.

2.1.1 Inductive Relation Predicate

The correspondence between the two state space W and t is captured by the inductively defined predicate.

$$r = (W = \{w \in \mathbf{dom}(t) | t(w) = 1\})$$

which we can translate into a relation function that transfers a concrete state space t to an abstract state space W:

$$f(t) = \{w \in \mathbf{dom}(t) | t(w) = 1\}$$

With that in mind, we can propose the initialisation predicate and corresponding operations of $DictA$.

2.1.2 Initialisation Predicate

We would like to define the initialisation predicate of DictA as follows:

$$init^{DictA} = (t := \{\epsilon \mapsto 0\})$$

2.1.3 Operations

We would like to define the operations of DictA as follows:

$$\begin{aligned}
&\mathbf{proc}\ addword^{DictA}(\mathbf{word}\ w) \cdot b, t : \\
&\quad [\textsc{true}, b = b_0 \wedge t = t_0 \backslash \{w \mapsto 0\} \cup \{w \mapsto 1\} \cup \{w' < w \wedge w' \notin \mathbf{dom}(t) | w' \mapsto 0\}] \\
&\mathbf{func}\ checkword^{DictA}(\mathbf{word}\ w) : \mathbb{B} \cdot \mathbf{var}\ b \cdot b, t : \\
&\quad [\textsc{true}, t = t_0 \wedge b = (\forall w' \leq w\, (w' \in \mathbf{dom}(t)) \wedge t(w) = 1)];\ \mathbf{return}\ b \\
&\mathbf{proc}\ delword^{DictA}(\mathbf{word}\ w) \cdot b, t : \\
&\quad [\textsc{true}, b = b_0 \wedge (w \notin \mathbf{dom}(t) \vee t = t_0 : w \mapsto 0)]
\end{aligned}$$

2.2 Proof of Refinement

Now we would like to start proving the refinements of the initialization and each operation from t to W.

We start from proving the refinement between $init^{DictA}$ and $init^{Dict}$.

$$
\begin{array}{ll}
& init^{DictA} \Rightarrow init^{Dict}[^{f(t)}/_{W}] \\
\Leftrightarrow & \quad \langle \text{Definition of } init^{DictA} \text{ and } init^{Dict} \rangle \\
& \forall w \in \mathbf{dom}(t)\,(t(w) = 0) \Rightarrow W = \phi
\end{array}
$$

Since all our precondition of concrete is trivial which all of them are TRUE, we don't need to proof the condition (3_f).But condition (4_f) must be checked for all three operations. For the *addword* we proof:

$$
\begin{array}{ll}
& pre_{addword^{Dict}}[^{f(t_0)}/_{W}] \wedge post_{addword^{DictA}} \\
\Leftrightarrow & \quad \langle \text{Definition of } addword^{Dict} \text{ and } addword^{DictA} \rangle \\
& \text{TRUE}[^{f(t_0)}/_{W}] \wedge b = b_0 \wedge t = t_0 \cup \{w \mapsto 1\} \cup \{w' < w \wedge w' \notin \mathbf{dom}(t) | w' \mapsto 0\} \\
\Rightarrow & \quad \langle \text{Definition of } f \rangle \\
& f(t) = f(t_0 \cup \{w \mapsto 1\} \cup \{w' < w \wedge w' \notin \mathbf{dom}(t) | w' \mapsto 0\}) \\
\Leftrightarrow & \quad \langle \text{Logic} \rangle \\
& f(t) = f(t_0) \cup \{w\} \\
\Leftrightarrow & \quad \langle \text{Definition of } addword^{Dict} \text{ and } addword^{DictA} \rangle \\
& post_{addword^{Dict}}[^{f(t_0), f(t)}/_{W_0, W}]
\end{array}
$$

For the *checkword* we proof:

$$
\begin{array}{ll}
& pre_{checkword^{Dict}}[^{f(t_0)}/_{W}] \wedge post_{checkword^{DictA}} \\
\Leftrightarrow & \quad \langle \text{Definition of } checkword^{DictA} \text{ and } checkword^{Dict} \rangle \\
& \text{TRUE}[^{f(t_0)}/_{W}] \wedge t = t_0 \wedge b = (\forall w' \leq w\,(w' \in \mathbf{dom}(t)) \wedge t(w) = 1) \\
\Rightarrow & \quad \langle \text{Definition of } f \rangle \\
& b = (w \in f(t) \wedge t(w) = 1) \wedge t = t_0 \\
\Leftrightarrow & \quad \langle \text{Definition of } checkword^{DictA} \text{ and } checkword^{Dict} \rangle \\
& post_{checkword^{Dict}}[^{f(t_0), f(t)}/_{W_0, W}]
\end{array}
$$

For the *delword* we proof:

$$
\begin{array}{ll}
& pre_{delword^{Dict}}[^{f(t_0)}/_{W}] \wedge post_{delword^{DictA}} \\
\Leftrightarrow & \quad \langle \text{Definition of } delword^{DictA} \text{ and } delword^{Dict} \rangle \\
& w \in f(t_0) \wedge b = b_0 \wedge (w \notin \mathbf{dom}(t) \vee t = t_0 : w \mapsto 0) \\
\Rightarrow & \quad \langle \text{Definition of } f \rangle \\
& f(t) = f(t_0) \backslash \{w\} \\
\Leftrightarrow & \quad \langle \text{Definition of } delword^{DictA} \text{ and } delword^{Dict} \rangle \\
& post_{delword^{Dict}}[^{f(t_0), f(t)}/_{W_0, W}]
\end{array}
$$

3 Task 3

We derive our code in to five parts by *init*, data type's operations and a *popWord* for recursive calls.

3.1 init

From the spec we have:

$$\begin{aligned} & \mathbf{dom}(t) = \{\epsilon\} \wedge f(t) = \phi \\ \sqsubseteq \quad & \langle \text{ass} \rangle \\ & t := \{\epsilon \mapsto 0\} \end{aligned}$$

3.2 popWord

We would like to define a semantic function $popWord(var\ word, var\ index)$ that returns a substring of the word w starting from the first letter to the index'th letter. A popWord is for us to have a easily use recursive calls, it is also a bridge between C and our Toy language[1]. The purpose of this function is to pop the first given letters of a given word.

3.2.1 Math Function

$$\begin{aligned} & POPWORD(w, i) = w' \\ & where\ w, w' \in \mathbf{word}\ \ \wedge i \in \mathbb{N} \wedge w' \leq w \wedge |w'| = i \end{aligned}$$

3.2.2 Toy Language Function

$$\begin{aligned} & \mathbf{func}\ popWord(\mathbf{value}\ w, \mathbf{value}\ i) \cdot \\ & \quad \llcorner \mathbf{var}\ w' \cdot w' : [i \leq |w|, w' \leq w \wedge |w'| = i]; \mathbf{return}\ w' \lrcorner_{(P1)} \end{aligned}$$

3.3 addword

From the spec[2] we have:

$$\begin{aligned} & \mathbf{proc}\ addword^{DictA}(\mathbf{value}\ w) \cdot \\ & \quad \llcorner b, t : [\text{TRUE}, b = b_0 \wedge t = t_0 \cup \{w \mapsto 1\} \cup \{w' < w \wedge w' \notin \mathbf{dom}(t) | w' \mapsto 0\}] \lrcorner_{(A1)} \end{aligned}$$

$$\begin{aligned} (A1) \sqsubseteq \quad & \langle \text{c-frame} \rangle \\ & t : [\text{TRUE}, t = t_0 \cup \{w \mapsto 1\} \cup \{w' < w \wedge w' \notin \mathbf{dom}(t) | w' \mapsto 0\}] \\ \sqsubseteq \quad & \langle \text{proc, } 0 \leq |w| \text{ and } \epsilon \in \mathbf{dom}(t) \text{ since } init^{DictA} \rangle \\ & doAddword(w, 0) \end{aligned}$$

[1] This fucntion would not appear in our C code, the pointer to the node would be solve this problem.And pointer is a difficult part for Toy Language to express and proof.

[2] Definition of this is in the Assignment 3 requirements of cs2111.

3.3.1 Definition of doAddword

$$\textbf{proc}\ doAddword^{DictA}(\textbf{value}\ w, \textbf{value}\ index)$$
$$\llcorner t : \left[\begin{array}{l} \forall w' \leq w \wedge |w'| \leq index\,(w' \in \textbf{dom}(t))\,, \\ t = t_0 \cup \{w \mapsto 1\} \cup \{w' < w \wedge w' \notin \textbf{dom}(t) | w' \mapsto 0\}] \end{array}\right] \lrcorner_{(A2)}$$

3.3.2 Refinement of the procedure in doAddword

$(A2) \sqsubseteq$ $\langle$if$\rangle$

if $index < |w|$

then $\llcorner t : [index < |w| \wedge pre(A2), post(A2)]\lrcorner_{(A3-1)}$

else $\llcorner t : [index \geq |w| \wedge pre(A2), post(A2)]\lrcorner_{(A3-2)}$

fi

$(A3-1) \sqsubseteq$ $\langle$seq$\rangle$

$$\llcorner t : \left[\begin{array}{l} index \geq |w| \wedge pre(A2), \\ index \geq |w| \wedge pre(A2) \wedge POPWORD(w, index+1) \in \textbf{dom}(t) \end{array}\right] \lrcorner_{(A3-3)}$$

$$\llcorner t : \left[\begin{array}{l} index \geq |w| \wedge pre(A2) \wedge POPWORD(w, index+1) \in \textbf{dom}(t), \\ post(A2) \end{array}\right] \lrcorner_{(A3-4)}$$

$(A3-3) \sqsubseteq$ $\langle$if$\rangle$

if $(POPWORD(w, index+1) \in \textbf{dom}(t))$

$$\textbf{then}\ \llcorner t : \left[\begin{array}{l} pre(A3-3) \wedge POPWORD(w, index+1) \in \textbf{dom}(t), \\ post(A3-3) \end{array}\right] \lrcorner_{(A3-3-1)}$$

$$\textbf{else}\ \llcorner t : \left[\begin{array}{l} pre(A3-3) \wedge POPWORD(w, index+1) \notin \textbf{dom}(t), \\ post(A3-3) \end{array}\right] \lrcorner_{(A3-3-2)}$$

fi

$(A3-3-1) \sqsubseteq$ $\langle POPWORD(w, index+1) \in \textbf{dom}(t) \Rightarrow post(A3-3) = \text{TRUE}\rangle$

skip;

$(A3-3-2) \sqsubseteq$ $\langle$Ass$\rangle$

$t := t \cup \{popWord(w, index) \mapsto 0\}$

$(A3-4) \sqsubseteq$ $\langle index \geq |w| \wedge index \leq |w| \Rightarrow index = |w|$ and definition of $post(A2)\rangle$

$doAddword(w, index+1)$;

3.4 checkword

From the spec we have:

$$\textbf{func}\ checkword^{DictA}(\textbf{value}\ w) : \mathbb{B}\cdot$$
$$\textbf{var}\ b \cdot \llcorner b, t : [\text{TRUE}, b = (\forall w' \leq w\,(w' \in \textbf{dom}(t)) \wedge t(w) = 1)]; \lrcorner_{(C1)}\ \textbf{return}\ b$$

$$
\begin{array}{rl}
(C1) \sqsubseteq & \langle \text{c-frame} \rangle \\
& b : [\text{TRUE}, b = (\forall w' \leq w\,(w' \in \mathbf{dom}(t)) \wedge t(w) = 1)]; \\
\sqsubseteq & \langle \text{proc, } 0 \leq |w| \text{ and } \epsilon \in \mathbf{dom}(t) \text{ since } init^{DictA} \rangle \\
& b := doCheckword(w, 0);
\end{array}
$$

$doCheckword()$ is a recursive function call that does the major checking work through the whole trie t with a variable i to locate which sub-trie it is checking in. The definition of the function and the refinement of its linking procedure is as follows.

3.4.1 Definition of doCheckword

$$
\mathbf{func}\ doCheckword(\mathbf{value}\ w, \mathbf{value}\ index : \mathbb{N}) : \mathbb{B} \cdot \\
\mathbf{var}\ b \cdot \llcorner b : \left[\begin{array}{l} 0 \leq index \leq |w| \wedge \\ \forall w' \leq w \wedge |w'| \leq index\,(w' \in \mathbf{dom}(t)), \\ b = (\forall w' \leq w\,(w' \in \mathbf{dom}(t)) \wedge t(w) = 1) \end{array} \right] \lrcorner_{(C2)}; \mathbf{return}\ b
$$

3.4.2 Refinement of the procedure in doCheckword

$$
\begin{array}{rl}
(C2) \sqsubseteq & \langle \text{if} \rangle \\
& \mathbf{if}\ index < |w| \\
& \mathbf{then} \llcorner b : [index < |w| \wedge pre(C2), post(C2)]_{\lrcorner(C3-1)} \\
& \mathbf{else} \llcorner b : [index \geq |w| \wedge pre(C2), post(C2)]_{\lrcorner(C3-2)} \\
& \mathbf{fi} \\
(C3-1) \sqsubseteq & \langle \text{if} \rangle \\
& \mathbf{if}\ (POPWORD(w, index+1) \in \mathbf{dom}(t)) \\
& \mathbf{then} \llcorner b : \left[\begin{array}{l} pre(C3-1) \wedge POPWORD(w, index+1) \in \mathbf{dom}(t), \\ post(C2) \end{array} \right] \lrcorner_{(C3-1-1)} \\
& \mathbf{else} \llcorner b : \left[\begin{array}{l} pre(C3-1) \wedge POPWORD(w, index+1) \notin \mathbf{dom}(t), \\ post(C2) \end{array} \right] \lrcorner_{(C3-1-2)} \\
& \mathbf{fi} \\
(C3-1-1) \sqsubseteq & \langle \text{ass, func} \rangle \\
& b := doCheckword(w, index+1); \\
(C3-1-2) \sqsubseteq & \langle \text{Ass and } POPWORD(w, index+1) \notin \mathbf{dom}(t) \Rightarrow b = \text{FALSE} \rangle \\
& b := \text{FALSE} \\
(C3-2) \sqsubseteq & \langle index \geq |w| \wedge index \leq |w| \Rightarrow index = |w| \text{ and definition of } post(C2) \rangle \\
& b := (t(w) = 1)
\end{array}
$$

3.5 delword

From the spec we have:

$$\textbf{proc}\ delword^{DictA}(\textbf{value}\ w)$$
$$\llcorner \cdot b, t : [\text{TRUE}, b = b_0 \wedge (w \notin \textbf{dom}(t) \vee t = t_0 : w \mapsto 0)] \lrcorner_{(D1)}$$

$$\begin{aligned}
(D1) \sqsubseteq \quad & \langle \text{c-frame} \rangle \\
& t : [\text{TRUE}, (w \notin \textbf{dom}(t) \vee t = t_0 : w \mapsto 0)] \\
\sqsubseteq \quad & \langle \text{proc, } 0 \leq |w| \text{ and } \epsilon \in \textbf{dom}(t) \text{ since } init^{DictA} \rangle \\
& doDelword(w, 0);
\end{aligned}$$

3.5.1 Definition of doDelword

$$\textbf{proc}\ doDelword^{DictA}(\textbf{value}\ w, \textbf{value}\ index)$$
$$\llcorner t : [\forall w' \leq w \wedge |w'| \leq index\,(w' \in \textbf{dom}(t)), (w \notin \textbf{dom}(t) \vee t = t_0 : w \mapsto 0)] \lrcorner_{(D2)}$$

3.5.2 Refinement of the procedure in doDelword

$$\begin{aligned}
(D2) \sqsubseteq \quad & \langle \text{if} \rangle \\
& \textbf{if}\ index < |w| \\
& \textbf{then} \llcorner t : [index < |w| \wedge pre(D2), post(D2)] \lrcorner_{(D3-1)} \\
& \textbf{else} \llcorner t : [index \geq |w| \wedge pre(D2), post(D2)] \lrcorner_{(C3-2)} \\
& \textbf{fi} \\
(D3-1) \sqsubseteq \quad & \langle \text{if} \rangle \\
& \textbf{if}\ (POPWORD(w, index+1) \in \textbf{dom}(t)) \\
& \textbf{then} \llcorner t : \left[\begin{array}{l} pre(D3-1) \wedge POPWORD(w, index+1) \in \textbf{dom}(t), \\ post(D2) \end{array} \right] \lrcorner_{(D3-1-1)} \\
& \textbf{else} \llcorner t : \left[\begin{array}{l} pre(D3-1) \wedge POPWORD(w, index+1) \notin \textbf{dom}(t), \\ post(D2) \end{array} \right] \lrcorner_{(D3-1-2)} \\
& \textbf{fi} \\
(D3-1-1) \sqsubseteq \quad & \langle \text{ass, func} \rangle \\
& doDelword(w, index+1); \\
(D3-1-2) \sqsubseteq \quad & \langle \text{Ass and } POPWORD(w, index+1) \notin \textbf{dom}(t) \Rightarrow post(D2) = \text{TRUE} \rangle \\
& skip; \\
(D3-2) \sqsubseteq \quad & \langle index \geq |w| \wedge index \leq |w| \Rightarrow index = |w| \text{ and definition of } post(D2) \rangle \\
& t := t : w \mapsto 0;
\end{aligned}$$
